Part III DETAILED ACTION

Response to Amendment

- 1. This office action is in response to Applicant's communication filed September 21, 2004. This amendment has been entered and carefully considered. Claims 1-36 are presented for examination.
- 2. Applicant's arguments with respect to claims 1-36 have been considered but are not deemed to be persuasive.
- 3. The non-statutory double patenting rejection is hereby maintained since claims 1-16 of patent application 10/033,440 (now patent 6,792,516) contains every element of claims 1-36 of the instant application and as such anticipates claims 1-36 of the instant application. Although the conflicting claims are not identical, they are not patentably distinct from each other because the claims in the current application are slightly broader in their new form as being compared to the limitations of the original claims. Examples are: Claims 1, 6, 10, 15, 19, 24, 28 and 33 of the current application are obvious slight variation of claims 1, 5, 9 and 13 of patent 6,792,516. The claims are not patentably distinct from each other because the claims are directed to the same method and system (memory arbiter) with a

Art Unit: 2186

memory device and controller configured to service the lower priority requests for a predetermined period if incoming higher priority request is directed to the same page of memory as the current lower priority requests.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. § 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 5. Claims 1-14 are rejected under 35 U.S.C. § 102(b) as being anticipated by Lewchuk et al. (USPN: 6,058,461); hereinafter Lewchuk.

As per claims 1 and 6; Lewchuk teaches the invention as claimed including a method and a memory arbiter for servicing data in a computer system comprising a memory area is taught as open page/priority storage 48 (e.g. see figure 2; column 8, lines 19-20); a memory controller coupled to the memory area is taught as memory controller 42 having a control unit 46 for receiving

Art Unit: 2186

memory requests and corresponding priorities from a microprocessor (e.g. see figure 2; column 5, line 61 bridging column 6, line 22; also column 8, lines 54 et seq.); Lewchuk further discloses the lower priority request is interrupted to serve higher priority request (e.g. see column 6, lines 11 et seq.) and wherein the memory controller is configured to continue to service current lower priority requests for a predefined period if an incoming higher priority request is directed to a same page of memory as the current lower priority requests is taught by Lewchuk; for example, starting at column 6, lines 63 et seq.; Lewchuk discloses to interrupt a memory operation to perform a higher priority memory operation comprises inserting the beats for the higher priority memory operation between two of the beats/cycles out of the four cycles for the lower priority memory operation; therefore the lower priority is still allowed to perform at least for a predefined period of at least two cycles before service the higher priority requests; by these rationales, claims 1 and 6 are rejected.

As per claims 2 and 7, the same agent is inherently taught and designated as either microprocessor A or microprocessor B which initiates a read/write memory operation to transfer data from/to main memory 14 as the lower priority request during the predefined period (e.g. column 6, line 47 et seq. bridging column 7, line 11);

Art Unit: 2186

As per claims 3 and 8, Lewchuk discloses after at least two cycles/beats of the lower priority memory operation, the higher cycle can be initiated (e.g. see column 6, lines 63 et seq.);

As per claims 4 and 9, Lewchuk discloses the memory controller unit 46 is configured to eventually resume servicing any lower priority requests (in-progress memory operation) after the high priority request is processed (e.g. see column 8, lines 65-68);

As per claim 5, the further limitation of a counter being used to monitor the predefined period is embedded in the system of Lewchuk since to determine the number of beats/cycles (being disclosed as two (2) cycles in Lewchuk's invention, e.g. see column 6, lines 64 bridging column 7, line 1) for interrupting a memory operation to perform a higher memory operation, a counter must be utilized to carry-out such operation; by this rationale, claim 5 is rejected.

As per claims 10-14, they encompass the same scope of invention as to that of claims 1-4, the claims are therefore rejected for the same reason as being set forth above. In addition, the processor for initiating a higher and lower priority memory requests is taught as processors 10 A,B (e.g. see figure 2, column 8, lines 11 and 38 et seq.).

-Page 6-

Application/Control Number: 10/038,941

Art Unit: 2186

Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lewchuck (USPN: 6,058,461).

As per claims 15-18; Lewchuck discloses the invention as claimed, detailed above with respect to claims 1-14; Lewchuck however does not particularly disclose a computer-readable medium of instructions to be implemented on a computer as being claimed in claims 15-18. However, one of ordinary skill in the art would have recognized that computer readable medium (i.e., floppy, cdrom, etc.) carrying computer-executable instructions for implementing a method, because it would facilitate the transporting and installing of the method on other systems, is generally well-known in the art. For example, a copy of the Microsoft Windows operating system can be found on a cd-rom from which Windows can be installed onto other systems, which is a lot easier that running a long cable or hand typing the software onto another system. The examiner takes Official Notice of this

Art Unit: 2186

teaching. Therefore, it would have been obvious to put Mattson's program on a computer readable medium, because it would facilitate the transporting, installing and implementing of Lewchuck's program on other systems.

8. Claims 19-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lewchuck (USPN: 6,058,461) in view of Iizuka et al. (USPN:5,699,521), hereinafter Iizuka.

As per claims 19 and 24, Lewchuk teaches the invention as claimed including a method and a memory arbiter for servicing data in a computer system comprising a memory area is taught as open page/priority storage 48 (e.g. see figure 2; column 8, lines 19-20); a memory controller coupled to the memory area is taught as memory controller 42 having a control unit 46 for receiving memory requests and corresponding priorities from a microprocessor (e.g. see figure 2; column 5, line 61 bridging column 6, line 22; also column 8, lines 54 et seq.); Lewchuk; however does not particularly disclose the memory controller is configured to interrupt servicing of higher priority requests after a predefined number are processed to process lower priority requests for a predefined period of time. Iizuka, in his teaching of communication system and method, clearly discloses the missing elements that is known to be required in Lewchuk in order to arrive at Applicant's current invention wherein Iizuka

Art Unit: 2186

discloses interrupting high priority servicing-data-request to allowing passing/servicing of nonpriority or low priority data request in order to prevent or keep the nonpriority or low priority data request from starvation (e.g. see column 11, lines 12-53). Accordingly, it would have been obvious to one having ordinary skill in the art at the time the current invention was made to look into the invention of Iizuka in order to utilize the teaching of "interrupting the higher priority service to allow for servicing of the lower priority requests" for that of Lewchuk invention. In doing so, it would enhance system reliability, and allow for continuously/uninterrupted servicing of system requests; since Iizuka clearly teaches that it would prevent or keep the nonpriority/low priority data requests from starvation; therefore being advantageous.

As per claims 20 and 25, Lewchuk discloses wherein the memory controller is configured to redefine the status of the higher priority requests to a lower priority status after a predefined number are processed (e.g. see column 8, lines 61 et seq.);

As per claims 21-22 and 26-27, the reinstatement of the higher priority requests to its initial priority status after the lower priority request is processed, and resuming the service of higher priority requests after the predefined period expires is taught by the Lewchuk as being equivalent to the control unit 46

Art Unit: 2186

resume the in-progress memory operation after completing the memory operation (e.g. column 8, lines 65-68);

As per claim 23, see arguments with respect to claim 5, in addition, it should be noted that Iizuka also discloses a counter for monitoring the number of high priority requests as being equivalent to the upper limit numbers of continuous fetch times of the queues and the current number of continuous fetch times of the queues are used to count the number of continuous fetch times of the priority data with the current number of continuous fetch times (e.g. see column 11, lines 14 et seq.);

As per claims 28-32, they encompass the same scope of invention as to that of claims 19-23, the claims are therefore rejected for the same reason as being set forth above. In addition, the processor for initiating a higher and lower priority memory requests is taught as processors 10A,B (e.g. see figure 2, column 8, lines 11 and 38 et seq.).

As per claims 33-36; the combination of Lewchuck and Iizuka disclose the invention as claimed, detailed above with respect to claims 19-32; Lewchuck and Iizuka however do not particularly disclose a computer-readable medium of instructions to be implemented on a computer as being claimed in claims 19-32. However, one of ordinary skill in the art would have recognized that computer readable medium (i.e., floppy, cd-rom, etc.) carrying computer-executable instructions for implementing a

Art Unit: 2186

method, because it would facilitate the transporting and installing of the method on other systems, is generally well-known in the art. For example, a copy of the Microsoft Windows operating system can be found on a cd-rom from which Windows can be installed onto other systems, which is a lot easier that running a long cable or hand typing the software onto another system. The examiner takes Official Notice of this teaching. Therefore, it would have been obvious to put Mattson's program on a computer readable medium, because it would facilitate the transporting, installing and implementing of Lewchuck and Iizuka's program on other systems.

9. As to the remark; Applicant's counsel argue that (a)
Lewchuck fails to disclose a memory arbiter that continues to
service current lower priority requests for a predetermined
period if an incoming higher priority request is directed to a
same page of memory as the current lower priority requests
(amendment's pages 10-11); (b) As per claims 15-18, for the same
reasons as discussed in detail above with regard to the rejection
of claims 1-14, Applicants assert that Lewchuck does not disclose
the invention as claimed in independent claim 15 regardless of
whether or not Lewchuck discloses a computer readable medium or a
computer readable medium would have been obvious to one of
ordinary skill in the art (amendment's page 11, third and fourth

Art Unit: 2186

paragraphs); (c) for claims 19-36, Applicants respectfully disagree with the Examiner's characterization of Iizuka, Applicants assert that Iizuka does not teach interrupting servicing of high priority requests to process low priority request, rather, Iizuka only discloses interrupting fetches of priority data with the fetching of nonpriority data (amendment's page 12).

With respect to (a); first of all, it should be noted that Lewchuck clearly discloses the condition of both requests are directed to the same memory wherein Luwchuck, starting at column 6, lines 11 et seq., teaches that by interrupting a lower priority memory operation to perform a higher priority memory operation in the same page only, the higher priority memory operation can be performed quickly (e.g. with a page hit timing); secondly, the further limitation of continues to service current lower priority requests for a predetermined period is equivalently taught by Lewchuck as during the interrupt procedure of the lower priority memory operation to perform higher priority memory operation, beats are inserted for the higher priority memory operation between two of the beats/cycles out of the four cycles for the lower priority memory operation; therefore it's clearly understood that the lower priority is still allowed to perform at least for a predefined period of at least two cycles before service the higher priority requests which anticipates

Art Unit: 2186

that claimed limitation of "continues to service current lower priority requests for a predetermined period" as being contended. With respect to (b), see arguments as being detailed above in (a). With respect to (c), it should be noted that, the Iizuka reference ('521) cited by Examiner for teaching the missing element of the memory controller is configured to interrupt servicing of higher priority requests after a predetermined number are processed to process lower priority requests, and in considering a 35 USC 103 rejection, it is not strictly necessary that a reference or references explicitly suggest the claimed invention (this is tantamount to a 35 USC 102 reference if the modifications would have been obvious to those of ordinary skill in the art. It has been held that the test of obviousness is not whether the features of a secondary reference may be bodily incorporated into the primary references' structure, nor whether the claimed invention is expressly suggested in any one or all of the references; rather, the test is what the combined teachings of the reference would have suggested to those of ordinary skill in the art. See <u>In re Keller et al.</u>, 208 U.S.P.Q 871. addition, Examiner further recognizes that references cannot be arbitrarily combined and that there must be some reason why one skilled in the art would be motivated to make the proposed combination of primary and secondary references. In re Nomiya, 184 USPQ 607 (CCPA 1975). However, there is no requirement that

-Page 13-

Application/Control Number: 10/038,941

Art Unit: 2186

a motivation to make the modification be expressly articulated. The test for combining references is what the combination of disclosures taken as a whole would suggest to one of ordinary skill in the art. In re McLaughlin, 170 USPQ 209 (CCPA 1971). Lewchuck and Iizuka references are evaluated by what they suggest to one versed in the art, rather than by their specific disclosures. In re Bozek, 163 USPQ 545 (CCPA) 1969. In this case, the Iizuka reference was used to provide evidence of interrupting high priority servicing-data-request to allowing passing/servicing of nonpriority or low priority data request in order to prevent or keep the nonpriority or low priority data request from starvation (e.g. see column 11, lines 12-53). combination would enhance system reliability by allow for continuously/uninterrupted servicing of system requests since Iizuka clearly teaches that it would prevent or keep the nonpriority/low priority data requests from starvation. USC § 103 rejection based on said combination of Lewchuck and Iizuka is therefore deemed to be proper.

10. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 C.F.R. § 1.136(a).

Art Unit: 2186

A SHORTENED STATUTORY PERIOD FOR RESPONSE TO THIS FINAL ACTION IS SET TO EXPIRE THREE MONTHS FROM THE DATE OF THIS ACTION. IN THE EVENT A FIRST RESPONSE IS FILED WITHIN TWO MONTHS OF THE MAILING DATE OF THIS FINAL ACTION AND THE ADVISORY ACTION IS NOT MAILED UNTIL AFTER THE END OF THE THREE-MONTH SHORTENED STATUTORY PERIOD, THEN THE SHORTENED STATUTORY PERIOD WILL EXPIRE ON THE DATE THE ADVISORY ACTION IS MAILED, AND ANY EXTENSION FEE PURSUANT TO 37 C.F.R. § 1.136(a) WILL BE CALCULATED FROM THE MAILING DATE OF THE ADVISORY ACTION. IN NO EVENT WILL THE STATUTORY PERIOD FOR RESPONSE EXPIRE LATER THAN SIX MONTHS FROM THE DATE OF THIS FINAL ACTION.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tuan V. Thai whose telephone number is (571)-272-4187. The examiner can normally be reached on from 6:30 A.M. to 4:00 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mathew M. Kim can be reached on (571)-272-4182. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
